

GarrCo Case Study

Grower Test Shows Adding **CONTROL™** Increases Corn Yield 25 Bushels Per Acre

Grower Kyle Harriman with Double H Farms, in cooperation with aerial applicator Perry Lowry of Lowry's Flying Service in Hamburg, Arkansas, wanted to test how effective GarrCo CONTROL drift mitigation and deposition adjuvant would be with the fungicide that they were applying to a 70-acre field. The field was very uniform so they split it in half and treated 35 acres with the fungicide alone and treated the other 35 acres with the fungicide plus CONTROL. The results clearly showed that CONTROL helped deliver more of the fungicide to the target and increased the corn yield from 232 to 257 bushels per acre - 25 bushels per acre!

CONTROL works in multiple ways:

- PREVENTS off-target movement so the effective amount in the field is higher,
- INCREASES spray coverage/deposition in the difficult-to-reach middle of the plant around the ear,
- REDUCES spray droplet bounce so more spray stays on the leaf and,
- KEEPS the spray deposit moist
