

# REMOVE™

## Spray System Cleaner

**REMOVE** is a concentrated, powerful, cleaning formulation that very effectively removes the tough-to-clean tank residues that often occur when pesticides, adjuvants and fertilizers are mixed together in different water qualities. When properly used, **REMOVE** completely cleans chemical residues out of the spray tanks, lines, nozzles, and all internal tank parts. The longer the residues remain in the tank, the further they can 'dehydrate', creating an even harder-to-clean situation. In this case, the **REMOVE** solution should be allowed to remain in contact with the residue for a longer time period.

Pesticide labels often require to use the use of a tank cleaner such as **REMOVE**. The recommended rate of **REMOVE** is 1 quart/100 gallons or more, depending on the severity of the residues. Higher rates can also offer faster cleaning times. To be most effective, the cleaning solution must contact with all of the internal spray system parts where residues can form and stay in contact long enough to completely penetrate the spray residues.

### FEATURES & BENEFITS:

- **USE RATE** of 1 qt/100 gal under most conditions, with higher rates giving faster results and potentially more effective removal of very difficult residues
- **CONCENTRATED** and **COST EFFECTIVE**
- **ALWAYS** read and follow the pesticide manufacturer label directions
